TRAINING OR RESEARCH ACTIVITY

During his master's degree, Dr. Massimo Dell'Edera gained experience in various spectroscopic techniques, including time-resolved UV-VIS spectroscopy, and practiced organic synthesis and protein biochemistry. He further developed his skills during his PhD work, where he extensively used colloidal synthesis techniques to obtain nano-materials with predetermined chemical and physical properties. Synthesized TiO₂-based nanoparticles were deposited onto different substrates for photocatalytic wastewater treatment and, thanks to the collaboration with Biotec s.r.l., a photocatalytic pilot plant was developed to treat polluted groundwater. During the visiting period at the University of Almeria he learned and applied

chromatographic and mass spectrometric analysis techniques, including UHPLC-DAD and HPLC MS/MS, for the analysis of organic molecules in aqueous matrices. He also has expertise in the deposition of nano-materials on different surfaces and their characterization using techniques such as TEM, SEM, AFM, FT-IR, UV-Vis-NIR, PL, and DRS.

During his post-doctoral experience, he expanded his knowledge of colloidal and sol-gel synthesis of metal oxide nanostructures for energy conversion and environmental remediation applications.

Therefore, Dr. Massimo Dell'Edera is a highly skilled and knowledgeable researcher in the field of nano-structured materials, with expertise in synthesis, deposition, and characterization, as well as in the analysis of organic molecules using chromatographic and mass spectrometric techniques.
