^(*) Common European Framework of Reference (CEF) level

During my academic career I have been part of the organizing committee of three scientific conferences (ManyVal 2008, ManyVal 2010 and Magica 16): see the last part of the curriculum for details.

My research area is about mathematical logic, in particular the hierarchy of many-valued logics introduced by Petr Hájek in (P. Hájek, *Metamathematics of Fuzzy Logic*, Kluwer, 1998). These logics are generalizations of classical (boolean) logic, in the sense that they possess (finitely or infinitely many) intermediate truth-values between the absolute true (1) and the absolute false (0), and are studied in the propositional and in the first order case. These logics are more expressive than the classical counterpart and can be used to cope with the vagueness of the information. Some examples of concepts that can be handled by these logics (in particular in the first-order case, where the predicates are interpreted as fuzzy sets) are sentences like “the temperature is high”, “the pressure is low”: more in general, the situations where there are properties that are vague (in the sense that there are some “borderline” elements for which it is not clear if they have this property or not), as the ones previously cited. In these cases the framework of classical logic, with only two truth-values, becomes quite rigid: the logics of Hájek’s frameworks, instead, are much more flexible and allow to grasp this vagueness, using intermediate truth-values.
